

Mobile Programming

Chapter 6: GOOGLE FIREBASE(Cont)

Mobile programming

1

Firestore with react native

Firestore Realtime Database

The Firestore Realtime Database is a cloud-hosted database.

Data is stored as JSON and synchronized in realtime to every connected client.

When you build cross-platform apps with Apple platforms, Android, and JavaScript SDKs
 Supporting both realtime data sync and offline capabilities.

Firestore Realtime Database

2

2

Firestore with react native

Installation

This module requires that the `@react-native-firebase/app`

Install & setup the app module

yarn add @react-native-firebase/app

Npm install @react-native-firebase/app

Install the database module

yarn add @react-native-firebase/database

Npm install @react-native-firebase/database

Mobile programming

3

3

Firestore with react native

A core concept to understanding Realtime Database are references - a reference to a specific node within your database. A node can be a specific property or sub-nodes.

To create a Reference, call the `ref` method

import database from '@react-native-firebase/database';

const reference = database().ref('/users/123');

NOTE: To get a reference to a database other than a 'us-central1' default database, you must pass the database URL. You can find your Realtime Database URL in the Realtime Database section of the Firebase console

const reference = firebase

.app()

.database('https://<databaseName>.<region>.firebase.database.app/')

.ref('/users/123');

Mobile programming

4

Firestore with react native

Reading data

One-time read

```
import database from '@react-native-firebase/database';
```

```
database()
  .ref('/users/123')
  .once('value')
  .then(snapshot => {
    console.log('User data: ', snapshot.val());
  });
```

Mobile programming

5

5

Firestore with react native

Reading data

Realtime changes

```
import database from '@react-native-firebase/database';
```

```
database()
  .ref('/users/123')
  .on('value', snapshot => {
    console.log('User data: ', snapshot.val());
  });
```

Mobile programming

6

6

Firestore with react native

Querying

Order

By default, results are ordered based on the node keys. If however you are using custom keys you can use one of the orderByX methods to order your data.

```
const scores = database().ref('scores').orderByValue().once('value');
```

Limiting

```
const users = database().ref('users').limitToFirst(10).once('value');
```

Mobile programming

7

7

Firestore with react native

Writing data

Setting data

The set method on a Reference overwrites all of the existing data at that reference node. The value can be anything; a string, number, object etc:

If you set the value to null, Firestore will automatically class the node as removed, and delete it from the database.

```
import database from '@react-native-firebase/database';
```

```
database()
  .ref('/users/123')
  .set({
    name: 'Ada Lovelace',
    age: 31,
  })
  .then(() => console.log('Data set.'));
```

Mobile programming

8

8

Firestore with react native

Writing data

Updating data

Firestore will automatically merge the data depending on what currently exists

import database from '@react-native-firebase/database';

```
database()
  .ref('/users/123')
  .update({
    age: 32,
  })
  .then(() => console.log('Data updated.'));
```

Mobile programming

9

9

Firestore with react native

Removing data

To remove data, you can call the remove method on a reference:

```
await database().ref('/users/123').remove();
```

Optionally, you can also set the value of a reference node to null to remove it from the database:

```
await database().ref('/users/123').set(null);
```

Mobile programming

10

Firestore with react native

Firestore Cloud Messaging

React Native Firestore provides native integration of Firestore Cloud Messaging (FCM) for both Android & iOS.

FCM is a cost free service, allowing for server-device and device-device communication.

The React Native Firestore Messaging module provides a simple JavaScript API to interact with FCM.

Mobile programming

11

11

Firestore with react native

Installation

This module requires that the `@react-native-firebase/app` module is already setup and installed

Install & setup the app module

`yarn add @react-native-firebase/app`

`npm install @react-native-firebase/app`

Install the messaging module

`yarn add @react-native-firebase/messaging`

`npm install @react-native-firebase/messaging`

Mobile programming

12

12

Firebase with react native

Android - Requesting permissions

On Android API level 32 and below, you do not need to request user permission. This method can still be called on Android devices; however, and will always resolve successfully.

For API level 33+ you will need to request the permission manually using either the built-in react-native PermissionsAndroid APIs or a related module such as react-native-permissions

```
import {PermissionsAndroid} from 'react-native';
PermissionsAndroid.request(PermissionsAndroid.PERMISSIONS.POST_NOTIFICATIONS);
```

Mobile programming

13

13

Firebase with react native

iOS - Requesting permissions

iOS prevents messages containing notification (or 'alert') payloads from being displayed unless you have received explicit permission from the user.

```
import messaging from '@react-native-firebase/messaging';
```

```
async function requestUserPermission() {
  const authStatus = await messaging().requestPermission();
  const enabled =
    authStatus === messaging.AuthorizationStatus.AUTHORIZED ||
    authStatus === messaging.AuthorizationStatus.PROVISIONAL;

  if (enabled) {
    console.log('Authorization status:', authStatus);
  }
}
```

Mobile programming

14

14

Firestore with react native

Receiving messages

State	Description
Foreground	When the application is open and in view.
Background	When the application is open, however in the background (minimised). This typically occurs when the user has pressed the "home" button on the device or has switched to another app via the app switcher.
Quit	When the device is locked or application is not active or running. The user can quit an app by "swiping it away" via the app switcher UI on the device.

Mobile programming

15

15

Firestore with react native

Message handlers

The device state and message contents determines which handler will be called:

	Foreground	Background	Quit
Notification	<code>onMessage</code>	<code>setBackgroundMessageHandler</code>	<code>setBackgroundMessageHandler</code>
Notification + Data	<code>onMessage</code>	<code>setBackgroundMessageHandler</code>	<code>setBackgroundMessageHandler</code>
Data	<code>onMessage</code>	<code>setBackgroundMessageHandler</code> (see below)	<code>setBackgroundMessageHandler</code> (see below)

Mobile programming

16

16

Firestore with react native

Notifications

The device state and message contents can also determine whether a Notification will be displayed:

	Foreground	Background	Quit
Notification	Notification: ✗	Notification: ✓	Notification: ✓
Notification + Data	Notification: ✗	Notification: ✓	Notification: ✓
Data	Notification: ✗	Notification: ✗	Notification: ✗

Mobile programming

17

17

Firestore with react native

Foreground state messages

The React Native Alert API could be used to display a new Alert each time a message is delivered

```
import React, { useEffect } from 'react';
import { Alert } from 'react-native';
import messaging from '@react-native-firebase/messaging';

function App() {
  useEffect(() => {
    const unsubscribe = messaging().onMessage(async remoteMessage => {
      Alert.alert('A new FCM message arrived!', JSON.stringify(remoteMessage));
    });

    return unsubscribe;
  }, []);
}
```

Mobile programming

18

18

Firestore with react native

Background & Quit state messages

To setup a background handler, call the `setBackgroundMessageHandler` outside of your application logic as early as possible

```
// index.js
import { AppRegistry } from 'react-native';
import messaging from '@react-native-firebase/messaging';
import App from './App';

// Register background handler
messaging().setBackgroundMessageHandler(async remoteMessage => {
  console.log('Message handled in the background!', remoteMessage);
});

AppRegistry.registerComponent('app', () => App);
```
